01 Who this is for

A software team preparing for launch, customer review, investment, acquisition, or a major release.

02 Common situations

- Pre-launch security review
- Customer or investor readiness
- Independent code audit

03 What you get

- Review of one application repository or clearly defined service
- Architecture, trust-boundary, and data-flow review
- Review of authentication, authorization, sessions, inputs, secrets, dependencies, and high-risk execution paths
- Findings report with evidence, severity, affected code, and remediation guidance
- Technical review session with the people responsible for the system

04 What the work produces

- A direct view of the security weaknesses found in the reviewed code
- Reproducible evidence for each material finding
- An ordered plan for correcting the highest-risk issues first

05 How the package is structured

- The review follows the application data flow and trust boundaries
- Findings identify the affected code and the reason the issue matters
- The handoff gives engineers a clear remediation sequence

06 Package terms

- One application repository or clearly defined service is included
- Access to the current source, dependency manifests, deployment notes, and architecture context is required
- A larger estate or a remediation implementation phase can be scoped separately
