01 Who this is for

A team that owns a web application and needs an independent security test before launch, customer review, or a major release.

02 Common situations

- Pre-launch penetration test
- Enterprise customer readiness
- Post-remediation verification

03 What you get

- Scope and rules-of-engagement review before testing begins
- Testing of one authorized web application and its directly connected API in one agreed environment
- Review of authentication, authorization, session handling, inputs, business logic, and exposed configuration
- Findings report with reproducible evidence, severity, impact, and remediation guidance
- Technical review session and one focused retest of corrected material findings

04 What the work produces

- A tested view of the application paths included in the written scope
- Evidence for confirmed weaknesses and the conditions required to reproduce them
- A remediation sequence and a focused verification of corrected material findings

05 How the package is structured

- Testing begins only after the owner approves the targets and rules of engagement
- The report separates confirmed findings from observations and recommendations
- The retest records whether agreed material findings were corrected

06 Package terms

- Written authorization from the system owner is required before active testing begins
- One web application, its directly connected API, and one agreed environment are included
- Third-party systems and shared infrastructure require separate written authorization from their owner

Shawn Lawyer

Architect · Developer · Founder · Researcher

I design software systems, build products and businesses, and develop research programs in evidence, longevity, and cognition.

Based in the United States. Available for remote engagements.
